

JAPANESE KNOTWEED

Looking for Rapid, Reliable & Guaranteed Eradication?

Xtract™, on-site remediation for the complete eradication of Japanese Knotweed in just days.

Environet is pleased to introduce you to Xtract™, the perfect on site remediation solution for the rapid, reliable and guaranteed eradication of your Japanese Knotweed problem.

Xtract™ is environmentally sound, herbicide free, and involves no haulage or disposal of infested soil to landfill.

Its less expensive than alternative methods, and benefits from guarantees of up to 20 years.

Xtract™ has been developed by Environet where rapid and reliable eradication of Japanese Knotweed is required, such as on development sites. Its suited to infestations large or small – as long as the infested soil can be safely excavated, it can be processed by Xtract™.

Xtract™ involves the excavation, segregation, and removal of ALL viable Japanese Knotweed rhizome in the soil – literally removing the root of the problem. No rhizome, no re-growth!

“ ... no rhizome, no re-growth!”

Knotweed free processed soil

Xtract™ is an on-site remediation method, eligible for Land Remediation Tax Relief.

For more information on claiming tax relief please call us.

“ environmentally sound ...”

Xtract™ reduces waste volumes by approx 98%, massively reducing financial and environmental costs relating to haulage and disposal to landfill. No environmentally harmful herbicides are applied, and the processed soils can be re-used on site without any further treatment.

Xtract™ uses unique patent pending technology developed by Environet. The Xtract™ machine is mounted on a road trailer, and is towed to site by Land Rover Defender. Its relatively small size allows it to fit in all but the very smallest development site.

Knotweed rhizome removed from infested soil using Xtract™

Xtract™ - for the rapid reliable and guaranteed eradication of Japanese Knotweed.

The process involves the physical excavation of all infested soils, typically using a 360° tracked excavator, capable of digging to at least 2m deep. The excavation work is supervised by one of our experts to ensure all soil containing viable rhizome, but not more than is necessary, is excavated.

The excavated infested soils are loaded by the excavator into the Xtract™ machine. The Xtract™ machine separates the Japanese Knotweed rhizome from the soil using vibration technology.

Clean processed soils are then immediately ready for re-use on site. The clean processed soils typically fall into two categories. The fines which are best used as topsoil and the oversize best used as backfill.

The extracted Japanese Knotweed rhizome is temporarily stored on site prior to being consigned off site in accordance with Environmental Protection Act 1990 requirements. Rhizome is either taken to an EfW (Energy from Waste) Plant or consigned to landfill depending upon the site location and quantity of rhizome.

“ ... problem solved in just days!”

Treatment takes a matter of days/weeks depending upon the quantity of material being processed.

A Post Treatment Management Plan, including your guarantee is issued upon completion.

BENEFITS

- ✓ **Avoid programme delays with rapid eradication in just days**
- ✓ **Reliable method with proven results - piece of mind, no rhizome - no regrowth!**
- ✓ **Environmentally sound, herbicide free, 98% reduction in waste to landfill**
- ✓ **Re-use processed soils on site without further treatment, avoid import of clean fill material**
- ✓ **The only UK company offering 20 year guarantees on Japanese Knotweed eradication.**

“We were very excited to discover Environet’s innovative Xtract method, which seemed to provide a very cost effective solution, with minimal adverse environmental impacts, that could also fit our tight works programme”

Andy Lee - Rotherham Metropolitan Borough Council.

3 SIMPLE STEPS!

1) Excavation

Japanese Knotweed infested soil is excavated under expert supervision.

2) Xtract™

Japanese Knotweed rhizome is segregated from infested soil using our unique Xtract™ process.

3) Re-use soils

Processed soils free from Japanese Knotweed ready for re-use on site without further treatment - Japanese knotweed rhizome removed from site.
